

OUR MISSION

Being ahead in creating ethical, innovative procedures and practices that will grant our customers the most efficient and cost effective logistics for their Projects, helping green energy to reach new markets and regions even those where logistics could impose a barrier.

OUR SERVICES

PROJECT DESIGN

PLG starts every project with a blank page. Once all the requirements, materials lists, site locations and schedule have been set, we chose the best point of entry or route for the Project. Based on our 30 years' experience in ports and logistics, we chose the best port/road for the components to be sent/received, route to site, and potential storage areas.

Once this is done, either by ourselves or jointly with our customer, we select the best sub-contractors for each step as required. We carry out the Road Survey and interact with local, regional or national authorities in advance, in order to make sure that obstacles are cleared and paperwork is ready by the time the Project is to be executed.

DEVELOPMENT

Once the Project has been designed, budgeted and approved by our customer, we proceed to sign contracts with all the sub-contractors and engage equipment and areas as might be required. We do so, once again, always considering the local regulations, good logistic practices and the legal main frame.

Once a sub-contractor has been selected, our Operations Compliance Officers proceed to make sure all personnel has been trained, not only on the procedures for handling and transporting the components, but also in general and specific HSE requirements making sure that when the Project starts, all tasks will be performed according to best-of-class logistics practices.

EXECUTION

During this phase, our personnel are physically present along all the stages, guaranteeing that the contractual terms and requirements are strictly followed. We keep a 24/7/365 on line tracking of all components that are under our scope, allowing for accurate planning ahead and introducing changes with due lead-time if this were to be required.

From ex works to job site, We deliver.

PLG belongs to a group which, for over 30 years has been dedicated to port operations and international logistics, developing new working ways that established the current market standards in South American countries.

We are experts in port operations, road transport and logistics coordination in a wide array of markets (Uruguay, Argentina, Bolivia, Paraguay and Mexico).

Our scope covers from port scouting to supervision and management of complete integrated logistic services, including road surveys, port operations, sourcing of trucking companies, storage areas and handling equipment, stock control and component tracking from ex-works to erection site, a "one stop shopping" for the complete logistics, on line 24/7/365.

Our commitment is to the higher standards of performance, always seeking the most cost effective way of achieving our customers' goals by being ahead of events, avoiding delays and minimizing incidentals or unexpected inconveniences.

PLG A trusted partner to maximize performance in Project logistics

We also know that sometimes, developing new markets or entering in new regions can be challenging and intimidating.

This is where a specialized logistics engineering company, with wide experience and reputation can be the secret to a successful Project.

Pricing the logistics is key, but not always a cheaper rate means a cheaper final cost. We specialize in negotiating with sub-contractors, and we do it jointly with our customers, thus is, we help them chose the best cost effective option.

Our commitment to compliance, guarantees that costs planned at the beginning of a Project will be the costs incurred at the end. No extra or unexpected expenses will distress the Project Manager once the Project is undergoing.

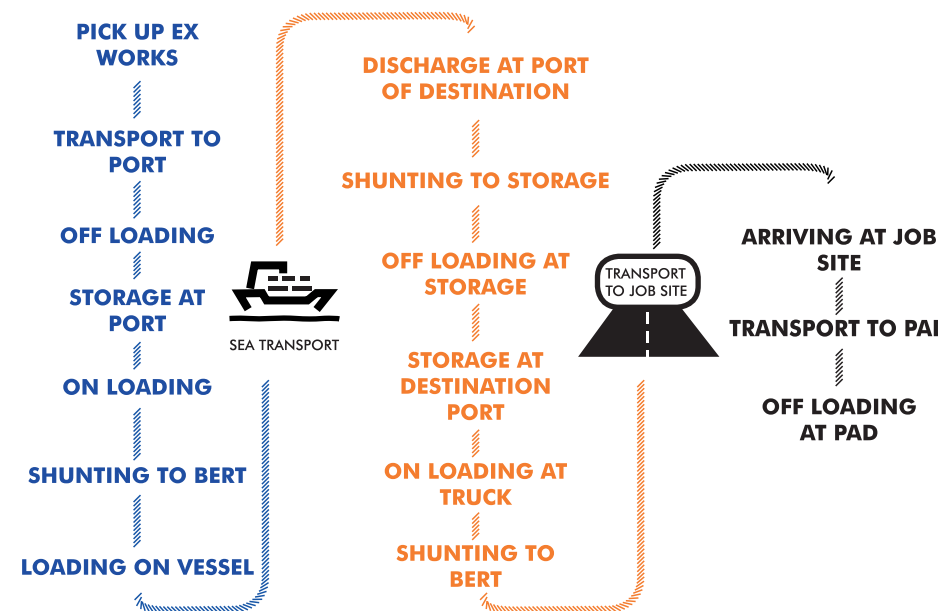

Some do project logistics...

WE DO MUCH MORE

OUR RECIPE TO SUCCESS

PLG Operations Diagram

Amanda EXCLUSIVE, STATE OF THE ART LOGISTICS CONTROL SYSTEM

In order to guarantee our committed Quality Standards, and make sure that these will be sustained along the full Project, for all our Projects, we have developed in house an exclusive software **Amanda** that control every step of the process, from ex-works to the job site, tracking each individual component by serial number, with all its details along every step, (images in case of damages, lashing arrangements for land or sea transport, etc), working on line 24/7/365.

This software, allows our customers to receive automated reports associated to events, as required, with stock control at all stages, transport status for each component, etc, without having to use spreadsheets or paper records.

The application also registers time and place for each event, allowing full control of trucking hours, idle time for trucks, equipment or vessel operations. Either by remote reporting or online active search, individual pieces or complete sets can be tracked.

With this tool, a Logistics Project Manager can handle more than one Project at a time without having to refer to multiple spreadsheets or daily activity reports. Needless to mention that this allows invoice checking and revision, on line cost evaluation, etc.

The use of this software is a very powerful tool that comes included in our services for all Projects. Data is collected by our own personnel via hand held terminals with GPRS/WiFi connectivity in a manner that we can issue interchange receipts on the spot, while these are being relayed to the designated parties.
